ART UNIT	PAPER NUMBER
2152	

DATE MAILED: 07/22/2005

Please find below and/or attached an Office communication concerning this application or proceeding.

	Application No.	Applicant(s)
Office Action Summary	09/843,760	BESAW, LAWRENCE M.
	Examiner	**Art Unit**	
	Dohm Chankong	2152	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE <u>3</u> MONTH(S) FROM
THE MAILING DATE OF THIS COMMUNICATION.
- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133).
  Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

1)☒ Responsive to communication(s) filed on <u>24 June 2005</u>.
2a)☐ This action is **FINAL.**   2b)☒ This action is non-final.
3)☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

4)☒ Claim(s) *21-53* is/are pending in the application.

    4a) Of the above claim(s) _____ is/are withdrawn from consideration.

5)☐ Claim(s) _____ is/are allowed.
6)☒ Claim(s) *21-53* is/are rejected.
7)☐ Claim(s) _____ is/are objected to.
8)☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

9)☐ The specification is objected to by the Examiner.
10)☐ The drawing(s) filed on _____ is/are: a)☐ accepted or b)☐ objected to by the Examiner.

    Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).

    Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).

11)☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

12)☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).

    a)☐ All   b)☐ Some * c)☐ None of:

      1.☐ Certified copies of the priority documents have been received.

      2.☐ Certified copies of the priority documents have been received in Application No. _____.

      3.☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

    * See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

1) ☒ Notice of References Cited (PTO-892)
2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
3) ☐ Information Disclosure Statement(s) (PTO-1449 or PTO/SB/08)
    Paper No(s)/Mail Date _____.

4) ☐ Interview Summary (PTO-413)
    Paper No(s)/Mail Date. _____ .
5) ☐ Notice of Informal Patent Application (PTO-152)
6) ☐ Other: _____.

DETAILED ACTION

1>   This action is in response to Applicants RCE and remarks. Claims 21-53 are presented

for further examination.

2>   This is a non-final rejection.

Response to Arguments

3>   Applicant's arguments with respect to claims 21-53 have been considered but are moot

in view of the new ground(s) of rejection.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all

obviousness rejections set forth in this Office action:

> (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

4>   Claims 21, 22, 26-28, 30, 32, 37, 38, 41-43, 45, 47, 52 and 53 are rejected under 35 U.S.C §

103(a) as being unpatentable over Lim et al, U.S Patent No. 6.434.619 ["Lim"], in view of

Callahan et al, U.S Patent Publication No. 2002|0157023 ["Callahan"].

5>   As to claim 21, Lim discloses a method for filtering on-line service information

provided through a management portal to a customer of customized network services

provided by resources of a service provider network, comprising:

applying a display filter to resources of the server provided network, said display filter

specifying network resources for which the on-line service information is desired by the

customer [column 4 «lines 46-66» | column 10 «lines 51-59»]; and

executing at least one management information module to generate a portal display of

on-line service information, wherein said at least one management information module

operates on only those network resources of said service provider network which have not

been excluded by said display filter [column 5 «lines 1-32» | column 10 «lines 24-59»].

Lim does not explicitly disclose utilizing a security filter.

6>   Lim does disclose utilizing authentication measures to allow a user access only to his

directory (partitioned storage) [column 9 «lines 24-27 and lines 53-57»] and then applying

appropriate filters [column 10 «lines 43-59»] after the user has been authenticated. But as

mentioned previously, Lim does not explicitly disclose a security filter. In the same field of

invention, Callahan is directed towards a system for allowing secure access to data. Callahan

discloses applying to said service provider network a security filter definable by service

provider and not the customer, said security filter corresponding to the customer and

specifying the network resources allocated to that customer [0052, 0054, 0089, 0096 :

'authenticate filter']. It would have been obvious to one of ordinary skill in the art to

incorporate Callahan's security filter into Lim's management system to provide a level of

security in accessing and viewing network resources. As Lim had already suggested the use

of authentication procedures in his data accessing system, one would have been particularly

motivated to provide such Callahan's cascading filter implementation as it would provide an

efficient, scalable and easy to configure way to manage network transactions [see Callahan,

0019].

7>   As to claim 22, Lim and Callahan disclose a method wherein applying said security

filter comprises:

applying a customer sub-filter to provide an association of said corresponding

customer and said network resources contained in said partitioned network allocated to the

customer [see Lim, column 9 «lines 18-27» | column 10 «lines 24-42» : "...data associated with

the customer are polled by the system..."].

8>   As to claim 26, Lim discloses a method for filtering on-line service information

presented through a management portal to a customer of customized network services

provided by resources of a service provider network, comprising:

partitioning the service provider network into a plurality of partitioned networks

[column 1 «lines 30-51» | column 3 «lines 22-29»];

allocating one of said partitioned networks to the customer [column 1 «lines 36-51» |

column 20 «lines 61-62» | column 21 «line 28»];

providing a plurality of modules each configured to provide a respective portal display

of on-line service information [column 4 «lines 46-51»];

storing, in a filter library accessible to the customer, of display filters each configured

to specify customer-selected network resources to which selected ones of said plurality of

modules is to be applied [column 4 «lines 46-66» | column 10 «lines 51-59»]; and

displaying a portal display of on-line service information generated from application

of one of said plurality of modules to network resources resulting from application to the

service provider network of at least one of said display filters [column 5 «lines 1-32» | column

10 «lines 24-59»].

Lim discloses a configuration database [column 7 «lines 56-60»] but does not

explicitly disclose security filters or storing them in the configuration database accessible by

the service provider and not the customer.

9>   Lim does disclose utilizing authentication measures to allow a user access only to his

directory (partitioned storage) [column 9 «lines 24-27 and lines 53-57»] and then applying

appropriate filters [column 10 «lines 43-59»] after the user has been authenticated. But as

mentioned previously, Lim does not explicitly disclose a security filter. In the same field of

invention, Callahan is directed towards a system for allowing secure access to data. Callahan

discloses applying to said service provider network a security filter definable by service

provider and not the customer, said security filter corresponding to the customer and

specifying the network resources allocated to that customer [0052, 0054, 0089, 0096 :

'authenticate filter']. It would have been obvious to one of ordinary skill in the art to

incorporate Callahan's security filter into Lim's management system to provide a level of

security in accessing and viewing network resources. As Lim had already suggested the use

of authentication procedures in his data accessing system, one would have been particularly

motivated to provide such Callahan's cascading filter implementation as it would provide an

efficient, scalable and easy to configure way to manage network transactions [see Callahan,

0019].

10>   As to claim 27, Lim and Callahan disclose a method wherein applying said security

filter comprises:

        applying a customer sub-filter to provide an association of said corresponding

customer and said network resources contained in said partitioned network allocated to the

customer [see Lim, column 9 «lines 18-27» | column 10 «lines 24-42» : "...data associated with

the customer are polled by the system..."].

11>   As to claim 28, Lim discloses a customer sub-filter that is configured to filter on at

least one of a node level and interface level of said service provider network [column 4 «lines

52-62» | column 5 «lines 1-24» : see Lim's interfaces].

12>   As to claim 30, Lim discloses specifying an internet protocol interface sub-filter of

said security filter, said IP interface sub-filter configured to filter on an IP address of a

network device [column 5 «lines 1-24»].

13>   As to claim 32, Lim discloses the method of claim 26 further comprising specifying an interface selection sub-filter of said display filter, said interface selection sub-filter configured to filter one of a set of at least one network interfaces [column 10 «lines 24-59»].

14>   As to claim 37, Lim discloses providing a network health module configured to display a status or health report network resources to which said network health module is applied [column 1 «line 63» to column 2 «line 3» | column 5 «lines 46-55»].

15>   As to claim 38, Lim discloses storing a network health sub-filter of the display filter, said network health sub-filter configured to identify which of said network elements to monitor for said status and health report [column 6 «lines 13-32»].

16>   As to claim 40, Lim discloses invoking said display filter by invoking said selected module [column 5 «lines 7-32»].

17>   As to claims 41-43, 45, 47, 52 and 53, as they are merely systems that implement the steps of the method of claims 26-28, 30, 32, 37 and 38, they do not teach or further define over the claimed limitations. Therefore, claims 41-43, 45, 47, 52 and 53 are rejected for the same reasons as set forth for claims 26-28, 30, 32, 37 and 38, supra.

18>   Claims 29, 39 and 44 are rejected under 35 U.S.C § 103(a) as being unpatentable over Lim and Callahan, in further view of Teijido et al, U.S Patent No. 2002|0053020 ["Teijido"].

19>   As to claim 29, Lim and Callahan do disclose utilizing sub-filters [see Callahan, 0052]

but do not explicitly disclose specifying an internet protocol host sub-filter of said security

filter, said IP host sub-filter configured to filter on a network name of a network device.

20>   Teijido discloses an internet protocol host sub-filter of said security filter, said IP host

sub-filter configured to filter on a network name of a network device [0049, 0070 : "...limit

access to only a predefined specific set of client machines."; "...host id"]. It would have been

obvious to one of ordinary skill in the art to incorporate Teijido's host sub-filter into Lim's

management system to provide a level of security in accessing and viewing network

resources. Such an implementation would ensure that the data can be tailored to a specific set

of client machines.

21>   As to claim 39, Lim does not explicitly disclose invoking said security filter by parsing

a customer record in said user configuration database.

22>   Teijido discloses invoking said security filter by parsing a customer record in said user

configuration database [0105, 0111 where: Teijido discloses checking a user's ASP]. It would

have been obvious to one of ordinary skill in the art to implement Teijido's user verification

functionality into Lim's management system to correlate a user with the documents or

information that he is allowed to access. Such an implementation would provide increased

security in Lim's system by preventing users from accessing information that they are not

allocated.

23>   As to claim 44, as it does not teach or further define over the previously claimed

limitations, it is rejected for the reasons set forth for claim 29, supra.

24>   Claims 23-25, 31, 33-36, 46 and 48-51 are rejected under 35 U.S.C § 103(a) as being

unpatentable over Lim and Callahan, in further view of Rangarajan et al, U.S Patent No.

6.275.225, ["Rangarajan"].

25>   As to claim 23, Lim and Callahan do not explicitly disclose an alarm module.

26>   Rangarajan discloses an alarm module configured to display information regarding

alarm conditions occurring in said non-excluded resources [Figure 5 «item 509» | column 5

«lines 50-53» | column 10 «lines 6-10» : wherein the devices correspond to network resources

and clients are only able to work with resources that have been assigned to them (excluded

resources)]. Furthermore, Lim discloses resources that can only be utilized by customers with

the property authority. It would have been obvious to one of ordinary skill in the art to

incorporate Rangarajan's alarm module into Lim's management system to allow users to

select nodes that would enable monitoring of alarm conditions in the network resources to

which they only have access. One would have motivated to perform such an implementation

enable users to more efficiently manage resources.

27>   As to claim 24, Lim and Callahan do not explicitly disclose a topology module

configured to display at least a graphical representation of network elements and connections

between said network elements included in said non-excluded network resources.

28>   Rangarajan discloses providing a topology module configured to display at least a

graphical representation of network elements and connections between said network

elements [Figure 9 «item 905» | column 6 «lines 27-36» | column 7 «lines 21-24»].

Furthermore, Lim discloses resources that can only be utilized by customers with the

property authority. It would have been obvious to one of ordinary skill in the art to

incorporate Rangarajan's topology module into Lim's management system to allow users to

more clearly see a map of the configuration of network resources to which they only have

access in the network. One would have been motivated to perform such an implementation

as such a map would allow users to more effectively manage the network resources.

29>   As to claim 25, Lim and Callahan do not explicitly disclose a network health module

configured to display a status or health report of said non-excluded network resources.

30>   Rangarajan discloses a network health module configured to display a status or health

report of said non-excluded network resources [Figure 9 «item 907» : "critical, major,

minor.."]. It would have been obvious to one of ordinary skill in the art to incorporate

Rangarajan's health module into Lim's data access system to allow users to keep track and remotely monitor network resources as needed.

31>   As to claim 31, Lim and Callahan do disclose utilizing sub-filters [see Callahan, 0052], but do not explicitly disclose a node selection sub-filter.

32>   Rangarajan discloses a node selection sub-filter of said display filter, said node selection sub-filter configured to filter on network nodes of the service provider network [column 6 «lines 27-33» | column 7 «lines 10-14»]. It would have been obvious to one of ordinary skill in the art to incorporate Rangarajan's node filtering functionality into Lim's management system to enable users to manage network devices through a user selected view of the nodes in the network.

33>   As to claim 33, Lim and Callahan do not explicitly disclose an alarm module.

34>   Rangarajan discloses an alarm module configured to display alarm conditions in network resources to which said alarm module is applied [Figure 5 «item 509» | column 10 «lines 6-10» : wherein the devices correspond to network resources]. It would have been obvious to one of ordinary skill in the art to incorporate Rangarajan's alarm module into Lim's management system to allow users to select nodes that would enable monitoring of alarm conditions in the network resources. One would have motivated to perform such an implementation enable users to more efficiently manage resources.

35>   As to claim 34, Lim and Callahan do not explicitly disclose an alarm sub-filter.

36>   Rangarajan discloses storing an alarm sub-filter of the display filter, said alarm sub-filter providing filtering capability of a display of alarm categories [column 6 «lines 27-36» | column 7 «lines 37-61»: "selected fault list"]. It would have been obvious to one of ordinary skill in the art to incorporate Rangarajan's alarm sub-filter into Lim's management system to enable users to select specific faults that they wish to keep track of in their management system.

37>   As to claim 35, Lim and Callahan do not explicitly disclose providing a topology module.

38>   Rangarajan discloses providing a topology module configured to display at least a graphical representation of network elements and connections between said network elements [Figure 9 «item 905» | column 6 «lines 27-36» | column 7 «lines 21-24»]. It would have been obvious to one of ordinary skill in the art to incorporate Rangarajan's topology module into Lim's management system to allow users to more clearly see a map of the configuration of network resources in the network. One would have been motivated to perform such an implementation as such a map would allow users to more effectively manage the network resources.

39>   As to claim 36, Lim and Callahan do not explicitly disclose storing a topology map

sub-filter.

40>   Rangarajan discloses storing a topology map sub-filter of the display filter, said

topology map sub-filter configured to identify which of said network elements and network

element connections to include in said topology map [Figure 9 «item 905» | column 6 «lines

27-36» | column 7 «lines 21-24 and 37-61»]. It would have been obvious to one of ordinary skill

in the art to incorporate Rangarajan's topology sub-filter into Lim's management system to

allow users to control over what network devices are seen on a map of the network. One

would have been motivated to perform such an implementation as such a map would allow

users to more effectively manage the network resources.

41>   As to claims 46 and 48-51, as they are merely systems that implement the steps of the

method of claims 31 and 33-36, they do not teach or further define over the claimed

limitations. Therefore, claims 46 and 48-51 are rejected for the same reasons as set forth for
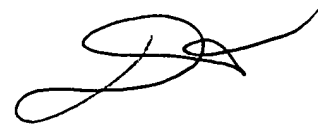

claims 31 and 33-36, supra.

Conclusion

Any inquiry concerning this communication or earlier communications from the

examiner should be directed to Dohm Chankong whose telephone number is (571)272-3942.

The examiner can normally be reached on 8:30AM - 5:30PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's

supervisor, Glenton Burgess can be reached on (571)272-3949. The fax phone number for the

organization where this application or proceeding is assigned is 703-872-9306.

Information regarding the status of an application may be obtained from the Patent

Application Information Retrieval (PAIR) system. Status information for published

applications may be obtained from either Private PAIR or Public PAIR. Status information

for unpublished applications is available through Private PAIR only. For more information

about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on

access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-

9197 (toll-free).
